

Part C:

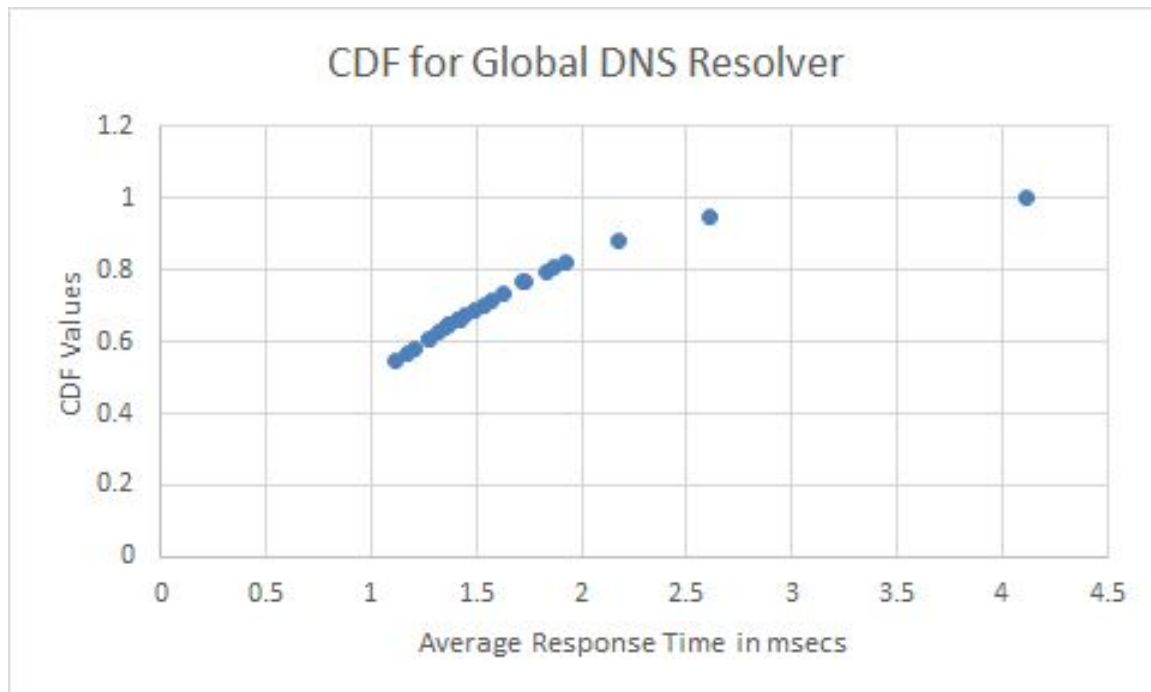

PDF for Global DNS resolver

CDF for Local DNS Resolver

From the three plots it could be observed that with the mydnsresolver the average response time is more than that compared to local dns ip and public dns ip. Also from the distribution it is clear that with my dns resolver the probability of the query may return in the time interval of 1.25 to 2.5 msec for mydnsresolver.

When we change the IP to the local dns resolver the response time has significantly improved. Even better than the Global DNS IPs. We could infer from all the three graphs that if a query is made

-> using mydnsresolver the probability that the query response may come in the range of 1.25 to 2.5 msec is more as compared to any other time window.

-> using local dns IP probability that the query response may come in the range of 0.5 to 1.5 msec is more as compared to any other time window.

-> using global dns IP probability that the query response may come in the range of 1 to 2 msec is more as compared to any other time window.

Part D:

```
sagar@sagar-Inspiron-5547:~/Documents$ python mydig.py www.cs.stonybrook.edu A
Status: NOERROR
Opcode: QUERY
www.cs.stonybrook.edu. 1994 IN A 130.245.27.2
